DETAILED ACTION

Allowable Subject Matter

1. Claims 1-22 are allowed.
2. The following is an examiner's statement of reasons for allowance: the examiner has determined that the combination of features for all independent claims is novel and non-obvious in light of the amendment and remarks provided.
3. The independent claims describe a method and system of processing an out of band control command executed by a host computer connected to a device (i.e. remote storage) via a multi-path system. When an out of band control command of the type described is created, it identifies a target physical path for transmission. The invention comprises a controller component of the host, located between the processor that executes the out of band command and a plurality of adapters to transmit the command, wherein the controller intercepts the command, determines if the command should continue upon the selected physical path, and chooses a different physical path to send the command. The controller then sends the command to the adapter corresponding to the selected path.
4. The examiner agrees with the applicant, as shown in the remarks section and examiner interview, that DeKoning relates to path redirection and selection after the corresponding adapters, and preferably outside the host. There is insufficient evidence regarding motivation to place the redirection process within the host and before the adapters. The examiner has determined that this selection process within the host and prior to the adapter, when combined with the other features, is novel and non-obvious.
